

## **Q1.Compare your procedural C version and OOP TaskList version: List 3 problems you faced in the C version that were solved by using classes and methods in the OOP version.**

### **Data was scattered**

- In C, task names and task status were stored in separate variables/arrays.
- In OOP, a **Task** class keeps related data together in one object.

### **Code was harder to manage**

- In C, functions worked on global or separate data, making the program harder to organize.
- In OOP, methods belong to classes, so the code is more structured.

### **Adding new features was difficult**

- In C, adding features required changing many parts of the program.
- In OOP, new properties and methods can be added to classes easily without affecting the whole program.
