

1. Name 5 IT job roles and write one line about what each role does.

- **Frontend Developer:** Focuses on creating the visual elements and interactive user interface of a website or application.
- **Backend Developer:** Manages server-side logic, database interactions, and application programming interfaces (APIs).
- **Web Software Developer:** Designs and builds applications specifically tailored for web browsers and online environments.
- **Flutter Developer:** Specializes in building cross-platform mobile applications using a single codebase for high performance.
- **Database Administrator:** Responsible for the secure storage, organization, and maintenance of an organization's data.

2. List 3 product companies and 3 service companies with one example of work each does.

Product Companies

- **Google:** Develops large-scale software products like Cloud platforms, Maps, and AI intelligence tools.
- **Refact.ai:** Provides a specialized AI Coding Assistant product that helps automate software engineering tasks.
- **LinkedIn:** Operates a global professional networking platform that offers job matching and networking services.

Service Companies

- **Accenture Services:** Delivers IT consulting and application support services to help other businesses manage their technology.
- **CGI Estonia:** Provides IT partnership services, such as implementing speech recognition tools for judicial systems.
- **Techify Solutions:** Offers specialized software development services, such as providing frontend engineering talent.

3. Write the full forms and one-line use of: GitHub, Slack, Jira, IDE, API.

- **GitHub:** (Name derived from "Git" and "Hub"). Used as a cloud-based platform for developers to store, track, and collaborate on software code using Git version control.
- **Slack:** (Stands for Searchable Log of All Conversation and Knowledge). Used as a centralized messaging and communication app for teams to organize conversations into channels and share files.
- **Jira:** (Originates from *Gojira*, the Japanese name for Godzilla). Used as an issue and project tracking software to plan, assign, and monitor team workflows and bug-fixing tasks.
- **IDE:** Integrated Development Environment. Used as a software application that provides developers with all the necessary tools (like a code editor, debugger, and compiler) in one place to write and test code.
- **API:** Application Programming Interface. Used as a bridge that allows two different software applications or systems to communicate and share data with each other

4. Name any 5 programming languages and mention one popular use case for each.

- **Java:** Widely used for building scalable enterprise applications and backend web services.
- **Python:** A preferred choice for developing artificial intelligence models and performing data analysis.
- **Kotlin:** The primary language recommended for modern Android mobile application development.
- **C++:** Utilized for high-performance systems programming, game engines, and low-level hardware interactions.
- **JavaScript:** The essential language for adding interactive features and dynamic content to web browsers.

5. What is the difference between a developer and a tester? Answer in 2 lines.

A developer is responsible for designing, writing, and building the functional code required to create a software feature.

In contrast, a tester evaluates that software to identify bugs and ensure it meets accuracy and quality standards before it is released.
